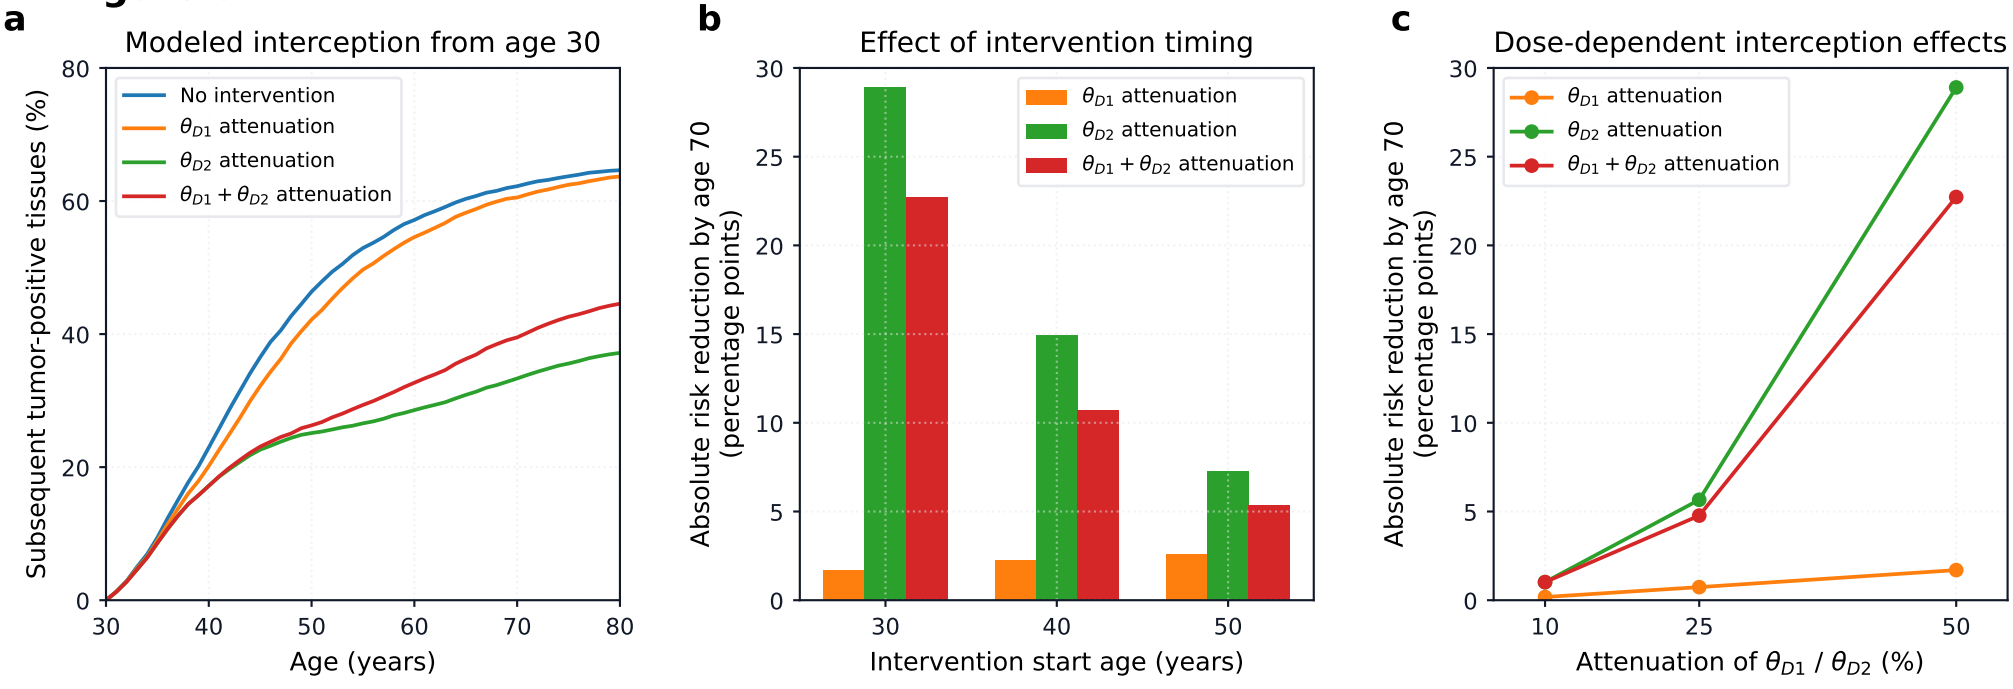
Figure 5



a
Modeled interception from age 30
Subsequent tumor-positive tissues (%)
Age (years)
No intervention
θ_{D1} attenuation
θ_{D2} attenuation
$\theta_{D1} + \theta_{D2}$ attenuation
b
Effect of intervention timing
Absolute risk reduction by age 70 (percentage points)
Intervention start age (years)
c
Dose-dependent interception effects
Absolute risk reduction by age 70 (percentage points)
Attenuation of θ_{D1} / θ_{D2} (%)
